

There are two girths, this is in case one of them snaps

## Therapeutic saddle for children with Cerebral Palsy

### 1. Saddling

The saddle is secured to the horse via a girth that goes round the stomach of the horse and fastens to a billet.

### 3. Therapy

The therapist leads the horse around while the child is sat securely on the saddle.

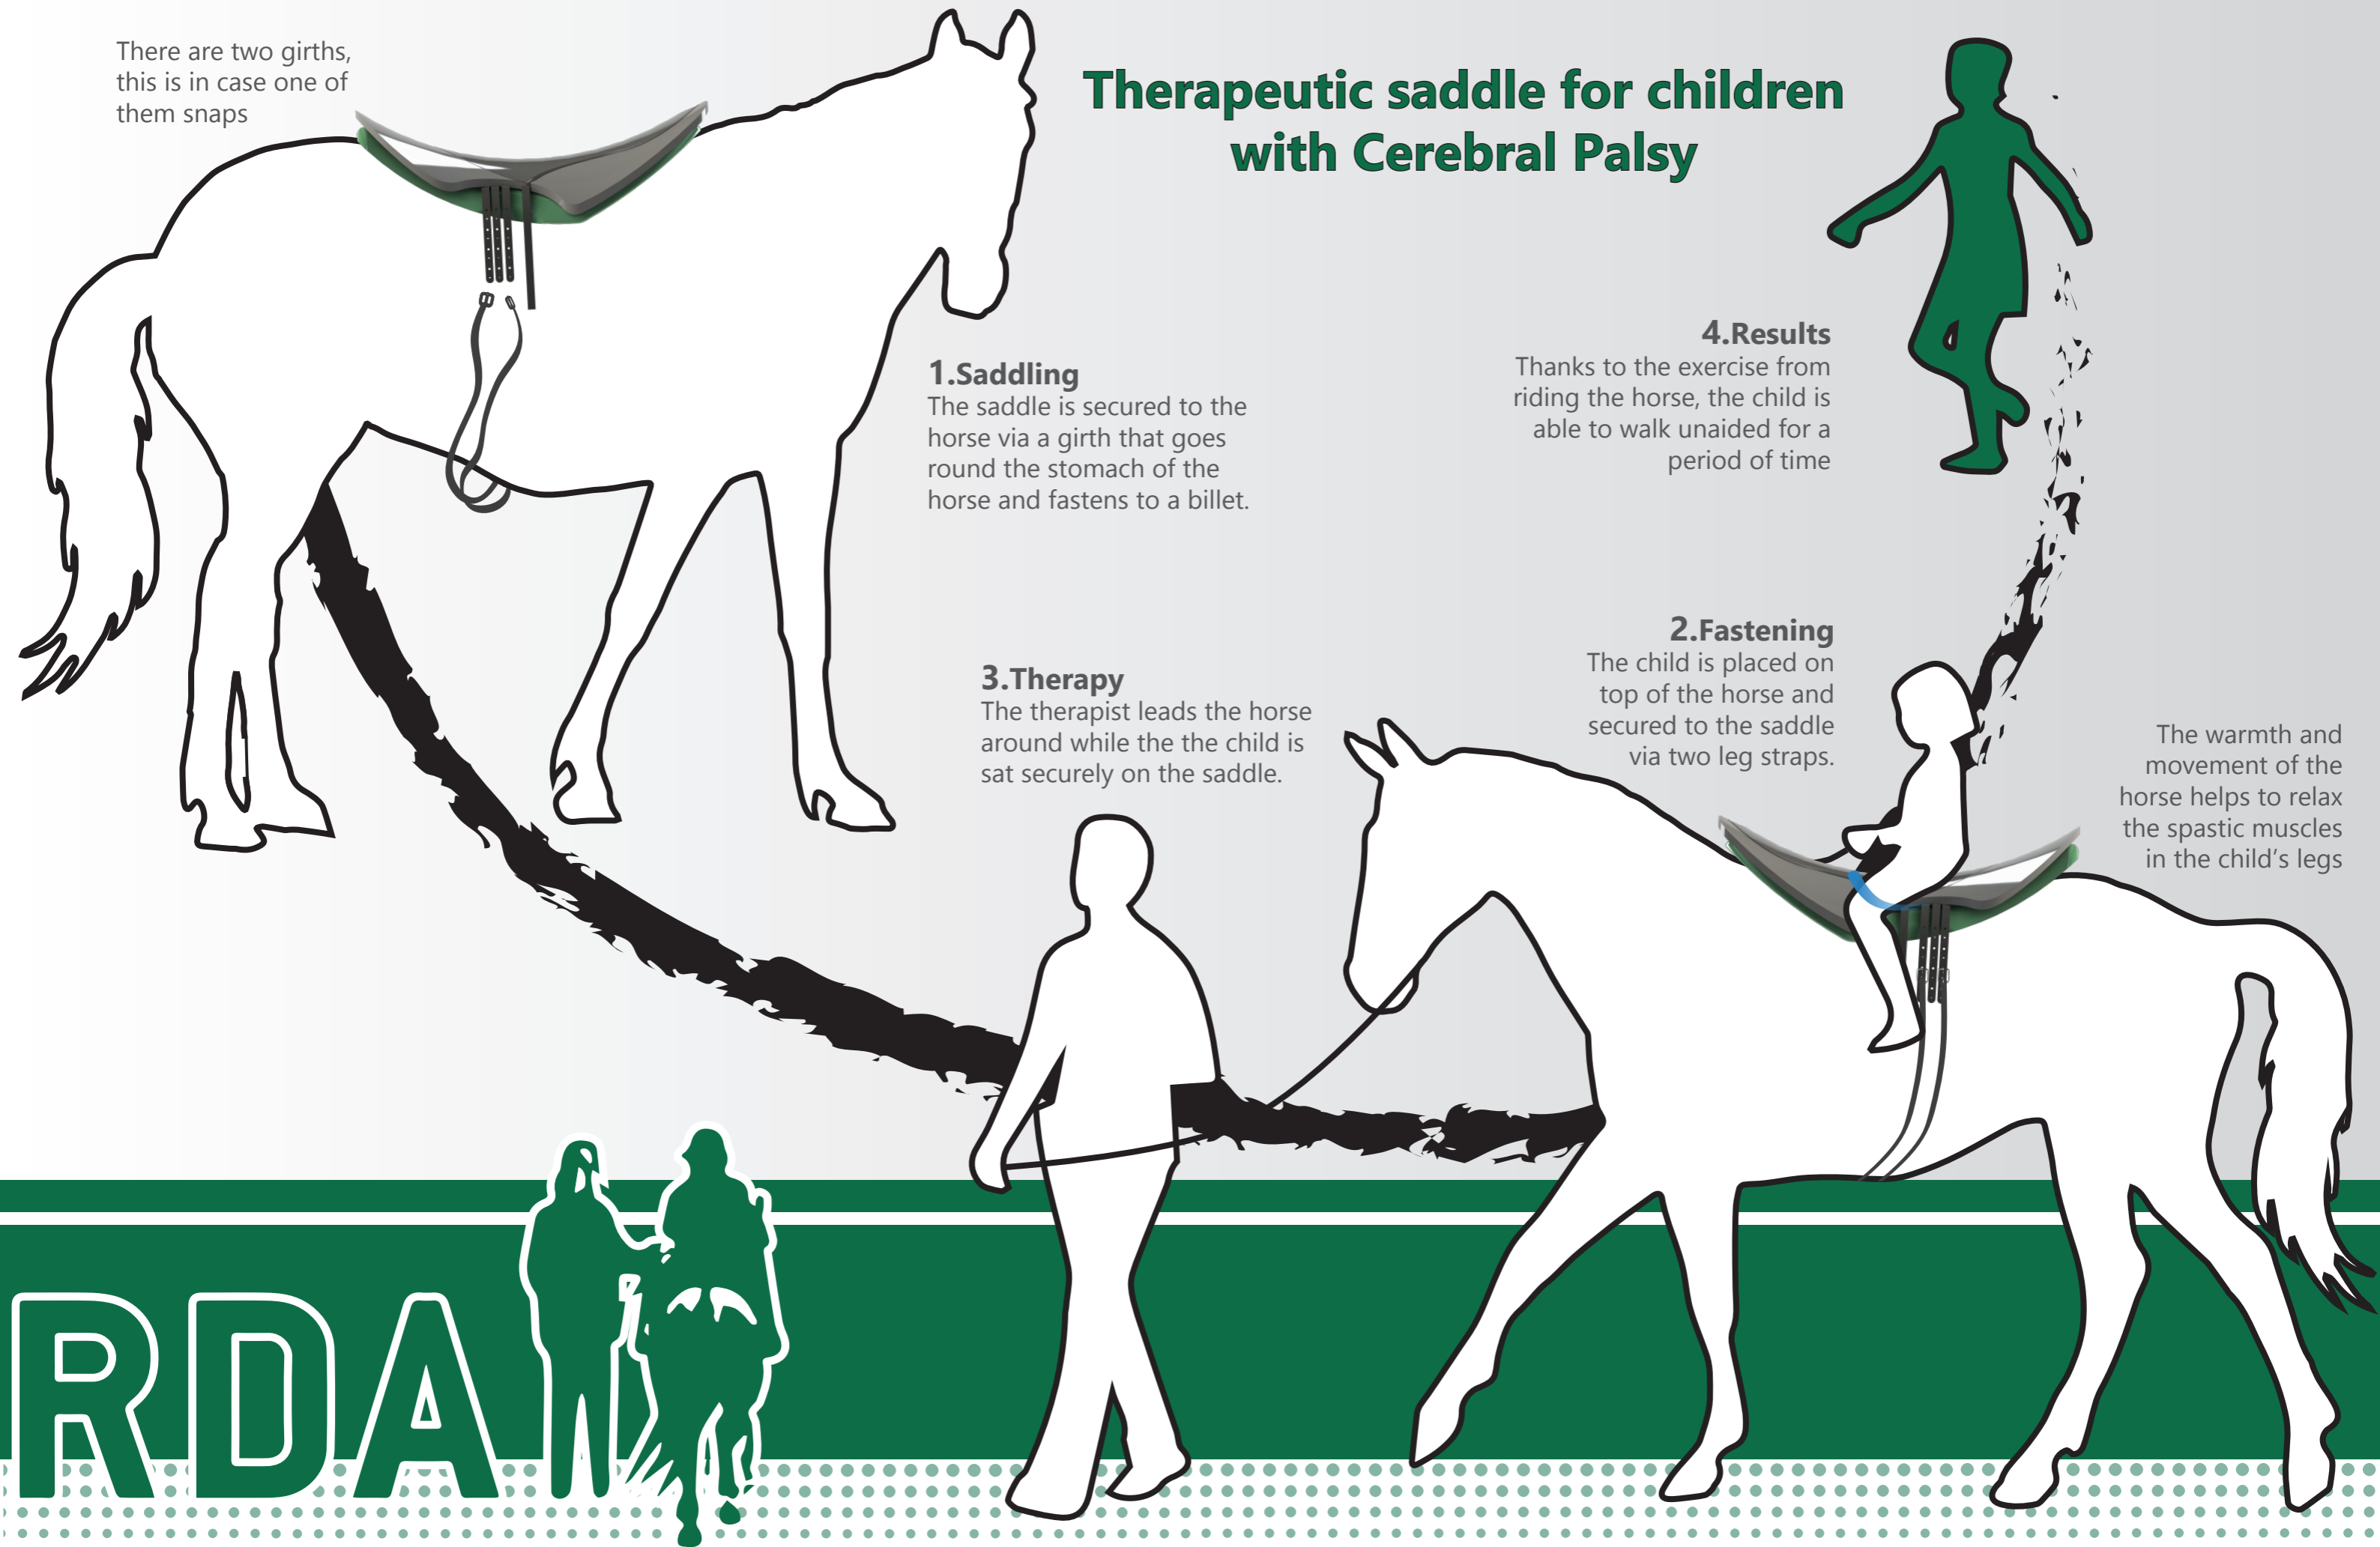

### 4. Results

Thanks to the exercise from riding the horse, the child is able to walk unaided for a period of time

### 2. Fastening

The child is placed on top of the horse and secured to the saddle via two leg straps.

The warmth and movement of the horse helps to relax the spastic muscles in the child's legs
